26. **Part (a)** for each section:

A totally wrong reagent scores zero
An incomplete reagent such as silver nitrate for Tollens, loses the reagent mark, but can get both observation marks.
A wrong reagent such as $[Ag(NH_3)_2]^{2+}$ or bromide water loses the reagent mark and the next mark "gained", i.e. can only score 1/3 if both observations correct

If two test given and results given correctly for both compounds in both tests then full marks
If one test on A and a different test on B with only these results given
if both results correct then score 2/3
if either result wrong then score 1/3
if either test would not work as a distinction, then score 0/3

If the candidate says A = ketone (or C = benzene), lose this mark.

If the candidate omits the letters when referring to the pair of compounds,
e.g. says alkene decolourises / alkane no reaction penalise one mark only.

(a) (i) penalise observations which just say colour change occurs or only state starting colour
